- CATALYTIC ACTIVITY: AFP-independent breakage of single-stranded DNA, followed by passage and rejoining.
- MISCELLANEOUS: WHEN A TOPOISOMERASE TRANSIENTLY BREAKS A DNA BACKBONE BOND, IT SIMULTANEOUSLY FORMS A PROTEIN-DNA LINK, IN WHICH A TYROSYL OXYGEN IN THE ENZYME IS JOINED TO A DNA PHOSPHORUS AT ONE END OF THE ENZYME IS JOINED TO A DNA PHOSPHORUS.
- SIMILARITY: BELONGS TO PROKARYOTIC TYPE I/III TOPOISOMERASE

-I'FUNCTION: THIS PROTEIN IS A COMFONENT OF RIBONUCLEOSOMES. COULD BE NEEDED TO ORGANIZE A CONFENTRATION GRADIENT OF A DORSALIZING MORPHOGEN (DM) ORIGINATING IN THE GERMINAL VESICLE.

-I'S SUBCELLULAR LOCATION: NUCLEAR AND/OR CYTOPLASMIC.

-I SIMILARITY: CONTAINS 2 RNA RECOGNITION MOTIFS (RRM).
                                                                                                                                                                                                                                           Gaps

I- FUNCTION: SEQUENCE-SPECIFIC TRANSCRIPTION FACTOR WHICH IS PART OF A DEVELOPMENTAL REGULATORY SYSTEM THAT PROVIDES CELLS WITH SPECIFIC POSTITIONAL DENTITIES ON THE ANTERIOR-POSTERIOR AXIS.
I- SUBCELLULAR LOCATION: Nuclear.
I- DEVELOPMENTAL STAGE: EXPRESSED IN WHOLE EMBRYOS AND FETUSES AT 5-9 WEEKS FROM CONCEPTION.
I- SIMILARITY: BELONGS TO THE ANTP FAMILY OF HOMEOBOX PROTEINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                    SUBCELLULAR LOCATION: CYTOPLASMIC.
DOMAIN: HAS A TWO DOMAIN STRUCTURE: THE G-DOMAIN BINDS GTP; THE
M-DOMAIN BINDS THE 7S RNA IN PRESENCE OF SRP19 AND ALSO BINDS THE
SEQUENCE FROM N.A.
MEDLINE=96144300; PubMed=8566805;
MEDLINE=96144300; PubMed=8566805;
Nucleotide sequence of the Aspergillus niger srpA gene.";
Gene 167:337-338(1995).
I- FUNCTION: BINDS TO THE SIGNAL SEQUENCE OF PRESECRETORY PROPEIN WHEN THEY EMERGE FROM THE RIBOSOMES AND TRANSFERS THEM TO TRAM (TRANSLOCATING CHAIN-ASSOCIATING MEMBRANE PROPEIN).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Drosophila melanogaster (Fruit fly).

PLAYS A ROLE IN GERM LINE SEX DETERMINATION.
-i- SUBCELLULAR LOCATION: Nuclear (Poctential).
-i- DEVELOPMENTAL STAGE: FIRST APPEARS IN THE GERMARIUM AND ACCUMULATES IN NURSE CELLS DURING OOGENESIS. STORED IN THE EGG, BUT IS RAPIDIX LOST IN THE EMBRYOS EXCEPT FOR ITS CONTINUED PRESENCE IN THE GERM LINE PRECURSOR POLE CELLS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Drosophila melanogaster (Fruit fly).

Biol. 4:539-547(1997).
FUNCTION: Calcium-regulated non-lysosomal thiol-protease which catalyze limited proteolysis of substrates involved in cytoskeletal remodelling and signal tranduction.
SUBUNIT: Heterodimer of a large (catalytic) and a small
                                                                                                                                                                                                                                                                                                                                                                                    CALCIUM BINDING.

MO1. Cell. Biol. 16:656-633(1996).
-!-FUNCTION: INHIBITS DNA BINDING OF TCF3 (E47) HOMODIMERS AND TCF3 (E47) / NEURODI HETERODIMERS AND ACTS AS A STRONG REPRESSOR OF WITH CLASS A BASIC HELIX-LOOP-HELIX FACTORS. DESPTTE THE PRESENCE OF AN INTACT BASIC DOMAIN, DOES NOT BIND TO DNA.
-!-SUBGLIGHAR LOCATION: NUCLEAR (PACTOR).
-!-SUBGLIGHAR LOCATION: NUCLEAR (PACTOR).
-!-TISSUE SPECIFICITY: KINNEY, LUNG, BRAIN AND PANCREAS (INSULINOMA).
-!-SIMILARITY: BELONGS TO THE BASIC HELIX (BHLH) FAMILY OF TRANSCRIPTION FACTORS. "ATONAL" SUBFAMILY.

Title: US-09-422-838C-34 Perfect score: 224

1 GGGGGIEGPTLRQWLAARAG......GGGGGGIEGPTLRQWLAARA 41

Scoring table: BLOSUM62 Gapop 10.0 , Gapext 0.5

Seguence:

Searched: 105224 segs, 38719550 residues

Total number of hits satisfying chosen parameters: 105224

Minimum DB seq length: 0 Maximum DB seq length: 200000000 Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

Database : SwissProt_40:*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

GCR 17 protein - fruit fly (Drosophila melanogaster)

GCR 17 protein - fruit fly (Drosophila melanogaster)

GSPecies: Drosophila melanogaster

C; Species: Drosophila melanogaster

C; Accession: 549194

R; Parchment, C.; Hughes, D.M.; Lloyd, P.; Flavell, A.J.

A; Bescription: A variety of different glycine repeats in Drosophila genes.

A; Recession: 549194

A; Status: preliminary

A; Status: preliminary

A; Status: Preliminary

A; Rocession: 549194

A; Residues: 1-196 «PAR>

A; Cross-references: EMBL: X71974; NID: 9510501; PID: 9510502

A; Accession: B2166
A; Molecule type: protein
C; Complex: heterodimer of L (large) and S (small) chains
C; Complex: heterodimer of L (large) and S (small) chains
A; Description: catalyzes the hydolysis of peptides
A; Note: cleaves preferentially after tyrosine, methonine, or arginine residues and b C; Keywords: acetylated amino end; calcium binding; cysteine proteinase; duplication;
E; Hopmain: calmodulin repeat homology <EF1>
F; Hopmain: calmodulin repeat homology <EF2>
F; Hodified site: acetylated amino end (Met) #status experimental
